Re: [Exact job title as posted]

Dear [Hiring Manager name / Hiring Team],

I am applying for the [job title] role at [Company]. I currently run the production virtualization platform at Philippine EDS Techno-Service, a Yazaki Japan affiliate. It is a 7-host bare-metal Proxmox VE environment carrying 24 LXC containers and 12 Linux and Windows VMs for roughly 700 staff. I am the escalation point when those systems break, and the one who deploys when something new has to ship.

Two things I have done there are worth your time. First, I cut VM and container build-to-ready provisioning time by roughly 93% by replacing manual builds with reusable Ansible playbooks and Terraform modules against the bpg/proxmox provider, which also ended the configuration drift that had been causing avoidable incidents. Second, I proposed and built a parallel Proxmox platform alongside our incumbent VMware estate, rebuilding services natively rather than converting VMs. Nobody assigned me that work; I costed it as a Kaizen/MUDA-elimination proposal, and it is projected to avoid over ₱8 million in commercial virtualization licensing.

That pattern is the thing I would bring to [Company]. When I see recurring manual work, I remove it. Most recently I self-initiated five Microsoft 365 Copilot agents for our IT department at zero additional licensing spend, including one that turns Japanese support tickets into technical English analysis for engineers who read no Japanese. I also build the applications that run on the infrastructure (Laravel, Vue 3, and Spring Boot), so I understand what the platform is actually carrying.

[One or two sentences specific to this company: name the technology in their posting you have direct experience with, or something about their infrastructure you find interesting. Delete this bracket before sending.]

My résumé is attached, along with a portfolio of certificates. I would welcome the chance to talk about what you are running and where I could take load off your team.

Sincerely,

Enrie John Edem
